Installing packages, this one is for readr which allows readtsv

Had to update rlang with code, `install.packages("rlang")`

`install.packages("readr")`

Code to load readr

```
library(readr)
```

```
## Warning: package 'readr' was built under R version 4.2.3
```

To read in trees dataframe

```
trees <- read_tsv('data-raw/TREE_SURVEYS.txt',  
                 col_types = list(HEIGHT = col_double(),  
                                 AXIS_2 = col_double()))
```

```
## Warning: One or more parsing issues, call 'problems()' on your data frame for details,  
## e.g.:  
##   dat <- vroom(...)  
##   problems(dat)
```

Received error when attempting to read\_tsv says could not find function read\_tsv

Received feedback from the instructor that library() must be used for readr package

Ran into issue that desired file does not exist in current working directory, fixed by switching directory

Ran into issue “Warning: One or more parsing issues, call problems()‘ on your data frame for details, e.g.: dat <- vroom(...) problems(dat)”

Managed to load in tree surveys data, can view now with, ‘View(trees)’

##created object canopy\_area with the \$ function by first using the specific table trees and then multipluing the columns

```
canopy_area <- (trees$AXIS_1*trees$AXIS_2)
```

Used this code to check if the columns multiplied properly by printing and then manually calculating first few values

```
canopy_area
```

```

Had to add the canopy\_area as a column to the trees data frame

```
trees$canopy_area <- canopy_area
```

Can view if the canopy was added with bottom code

```
View(trees)
```

Finally after about 30mins of attempting to subset I finally managed to. Turns out I tried subsetting by names, but for this format it required numbers representing the columns.

```
subset(trees[c(1, 2, 3, 17)])
```

```

Needed to create dataframe subset of trees

```
trees_subset <- subset(trees[c(1, 2, 3, 17)])
```

Can view the subset produced with View() function

```
View(trees_subset)
```

Plot(*trees**canopy\_area*, *trees**HEIGHT*, pch=2, col=*trees**TREATMENT*) had issues

Kept getting error, Error in plot.xy(xy, type, ...) : invalid color name 'TOTAL', to fix issue I found that I needed to change the TREATMENT from a character to a factor type.

Issue was fixed with code: *trees**TREATMENT* = *as.factor(trees**TREATMENT)*

```
trees$TREATMENT = as.factor(trees$TREATMENT)
```

Had to set color with code:

```
col=rgb(100,0,0,50,maxColorValue=255)
```

This code functions as `plot(x axis, y axis, pch(which is point size), col(defined color) = (set variable for distinguishing data))`

```
plot(trees$canopy_area, trees$HEIGHT, pch=2, col=trees$TREATMENT, xlab = "Canopy Area (m)", ylab = "Height (m)")
```

Read in ggplot2

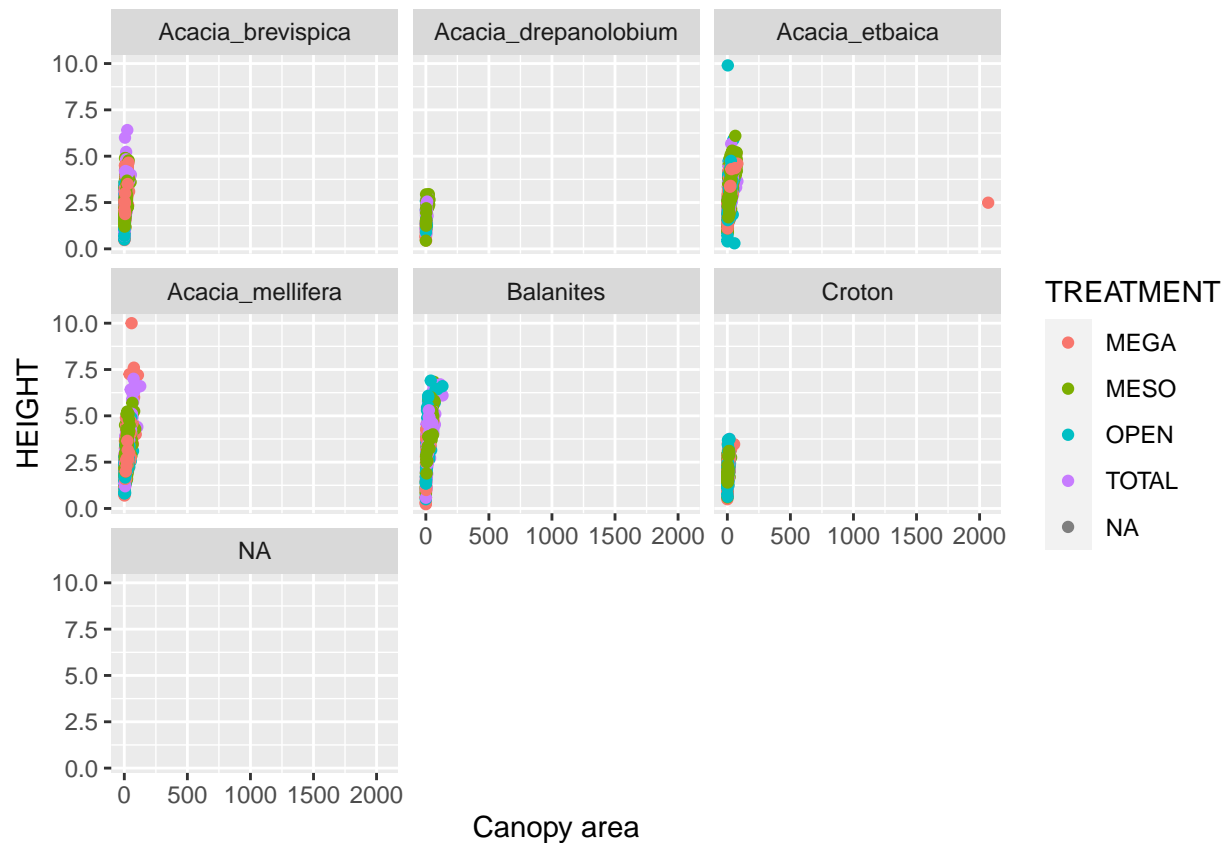

```
library(ggplot2)
```

```
## Warning: package 'ggplot2' was built under R version 4.2.3

Now use the code below to make subplots

```
ggplot(data = trees, mapping = aes(x = canopy_area, y = HEIGHT, color = TREATMENT)) + geom_point() +  
labs(x = "Canopy area") +  
facet_wrap(~SPECIES)
```
